

Early detection is the key to preserving healthy tooth structure.

Healthy Tooth

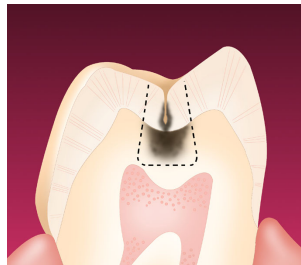

White decalcification and subsurface staining are visual signs of possible decay

Initial Decay

Advanced Decay

The benefits of early treatment with the Fissurotomy® System:

- No need for anesthesia up to the DEJ (Dentin Enamel Junction)
- Preserves healthy tooth structure
- Prevents further spread of decalcification
- Can be filled with tooth colored resin

The negative impact of advanced decay:

- Usually requires anesthesia
- Significant loss of tooth structure & strength
